Subject No security on "Install service"

Description of Problem or Suggestion:

The install service will download and install service on client workstations. The currently designed security context was stated as "buyer beware". I believe this is insufficient to provide acceptable user assurance and to protect ECS reputation, at least for, "officially" supported clients. There are vulnerabilities to spoofing, surreptitious software substitution.

Originator's Recommendation

Provide a mechanism for optional authentication of the installed and integrity checks on downloaded software.
